

## **Title**

**[R] matsize** — Set the maximum number of variables in a model

## **Syntax**

```
set matsize # [, permanently]
```

where  $10 \leq \# \leq 11000$  for Stata/MP and Stata/SE and where  $10 \leq \# \leq 800$  for Stata/IC.

## **Description**

**set matsize** sets the maximum number of variables that can be included in any of Stata's estimation commands.

For Stata/MP and Stata/SE, the default value is 400, but it may be changed upward or downward.

For Stata/IC, the initial value is 400, but it may be changed upward or downward. The upper limit is 800.

The command may not be used with Small Stata; **matsize** is permanently frozen at 100.

Changing **matsize** has no effect on Mata.

## **Option**

**permanently** specifies that, in addition to making the change right now, the **matsize** setting be the default setting when you invoke Stata.

## **Example**

```
. regress y x1-x400  
matsize too small
```

You have attempted to create a matrix with more than 400 rows or columns or to fit a model with more than 400 variables plus ancillary parameters. You need to increase matsize by using the set matsize command; see [r\(908\)](#).

```
. set matsize 450
```

```
. regress y x1-x400  
(output appears)
```
